Research Summary

Microsilica, also known as silica fume, is a highly reactive and amorphous form of silicon dioxide (SiO₂) that is produced as a byproduct during the production of silicon or ferrosilicon alloys in the smelting process. It consists of very fine particles with an average diameter of less than 1 micron. Microsilica is known for its high surface area and low bulk density, giving it unique properties and applications. It is added to concrete, refractory materials, and composites as a supplementary cementitious material or additive to improve the mechanical properties and durability of the final product. Microsilica is highly pozzolanic, meaning it reacts with calcium hydroxide in the presence of water to form additional cementitious compounds, resulting in a denser and stronger material. By filling the voids in the microstructure of concrete, it reduces permeability and enhances resistance against chemical attack, abrasion, and shrinkage. It also contributes to the reduction of heat of hydration and improves the rheological properties of concrete. Microsilica is widely used in construction, infrastructure development, and high-performance applications to enhance the quality and performance of concrete and other materials.

The major global manufacturers of Silica Fume include Evonik, Cabot, Wacker Chemie, Tokuyama, Orisil, Cabot Bluestar, Wynca, Tokuyama (Zhejiang), Wacker (Zhangjiagang), Guangzhou GBS, Hangzhou Wan Jing, Jiangxi Blackcat, Shanghai Chlor-Alkali, Shenyang Chemical, AnHui JingYe, Jiangxi HuaDeRun, Fushite, Yichang CSG, etc. The global players competition landscape in this report is divided into three tiers.
