Research Summary

Silico manganese is a ferroalloy composed primarily of manganese (Mn), silicon (Si), and iron (Fe). Produced by smelting a combination of manganese ore, quartz, and iron ore in a submerged arc furnace, silico manganese is widely used as a deoxidizer and alloying agent in the steelmaking industry. Its primary function is to enhance the properties of steel by improving its strength, toughness, and hardenability. The silicon content in silico manganese helps deoxidize the steel, removing impurities such as oxygen and sulfur, while the manganese content contributes to the steel's strength and wear resistance. Additionally, silico manganese can help control the grain size of steel and promote the formation of desirable phases during the solidification process. As a result, it finds extensive applications in the production of various steel grades, including structural steels, low-alloy steels, and stainless steels, across diverse industries such as construction, automotive, and manufacturing.

The major global manufacturers of Silico Manganese include PJSC Nikopol, Erdos Group, Sheng Yan Group, Ningxia Jiyuan Metallurgical Group, Henan Xibao Metallurgy
