Research Summary

Silicon anode material refers to a type of material used in lithium-ion batteries (LIBs) where silicon is utilized as the anode component instead of traditional graphite. Silicon offers a significantly higher theoretical capacity for lithium storage compared to graphite, making it an attractive candidate to enhance the energy density and performance of batteries. The appeal of silicon lies in its ability to alloy with lithium ions, forming lithium-silicon alloys during battery charging. This process allows silicon anodes to store more lithium ions per unit mass, potentially leading to batteries with higher energy density and longer runtime. However, silicon anodes face challenges such as volume expansion during lithiation (charging) and delithiation (discharging) cycles, which can cause mechanical stress and lead to degradation of the battery performance over repeated cycles. Researchers are actively working on engineering solutions such as nanostructuring, coating technologies, and alloying strategies to mitigate these issues and realize the full potential of silicon anode materials for next-generation lithium-ion batteries.

The major global manufacturers of Silicon Anode Material include BTR, Shin-Etsu Chemical, Daejoo Electronic Materials, IOPSILION, Luoyang Lianchuang, Shanshan Corporation, Lanxi Zhide Advanced Materials, Guangdong Kaijin New Energy, Group14, Jiangxi Zhengtuo Energy, Posco Chemical, Shida Shenghua, Showa Denko, Chengdu Guibao, Shanghai Putailai (Jiangxi Zichen), Hunan Zhongke Electric (Shinzoom), Shenzhen XFH, iAmetal, Guoxuan High-Tech, Nexeon, Sila Nanotechnologies, etc. The global players competition landscape in this report is divided into three tiers.
