### Research Summary

A silicon oxide (SiOx) precursor is a chemical compound or mixture used to deposit thin films of silicon oxide onto substrates through various deposition techniques, such as chemical vapor deposition (CVD), atomic layer deposition (ALD), or sol-gel processes. These precursors typically contain silicon and oxygen atoms in different ratios, allowing for the controlled formation of silicon oxide films with specific compositions and properties. Silicon oxide precursors may also include additional dopants or additives to tailor the film's characteristics, such as refractive index, dielectric constant, or thermal stability, to meet the requirements of specific applications. These precursor materials are widely used in semiconductor manufacturing, optical coatings, microelectronics, and thin-film technologies to create insulating layers, passivation layers, and protective coatings with precise thickness, uniformity, and performance, contributing to the advancement of various electronic devices and systems.
