Research Summary

A silicon photodiode is a semiconductor device that converts light energy into electrical current when exposed to photons. It typically consists of a silicon wafer with a p-n junction, where one region is doped to create an excess of free electrons (n-type) and the other region is doped to create an excess of positively charged ?holes? (p-type). When photons strike the photodiode, they generate electron-hole pairs within the depletion region of the p-n junction. These charge carriers are then separated by the electric field present in the junction, resulting in a flow of electrical current proportional to the incident light intensity. Silicon photodiodes are widely used in various applications such as light detection, imaging, spectroscopy, optical communications, and remote sensing due to their high sensitivity, fast response time, low noise, and compatibility with integrated circuit technology, contributing to advancements in numerous fields.

The major global manufacturers of Silicon Photodiode include Hamamatsu Photonics, Excelitas Technologies, OSI Optoelectronics, NJR, Vishay, Honeywell, TTE, Kyosemi, Edmund Optics, Opto Diode, etc. The global players competition landscape in this
