Research Summary

Silver sintering paste is a specialized material used in the production of power electronic devices and semiconductor components. Composed of silver particles suspended in a solvent and a binder, this paste is applied onto semiconductor substrates such as silicon carbide (SiC) or gallium nitride (GaN) using techniques like screen printing or dispensing. Upon drying and sintering at elevated temperatures, the solvent evaporates, and the binder decomposes, leaving behind a layer of silver particles that bond with the substrate and adjacent components through a process known as sintering. Silver sintering paste offers advantages over traditional soldering techniques, such as lower processing temperatures, reduced thermal resistance, and improved reliability due to the formation of robust, high-conductivity interconnections. It is widely used in the fabrication of power modules, high-frequency devices, and automotive electronics where high power densities, high operating temperatures, and long-term reliability are critical requirements.

The major global manufacturers of Silver Sintering Paste include Heraeus, Kyocera,

Indium, Alpha Assembly Solutions, Henkel, Namics, Advanced Joining Technology, Shenzhen Facemoore Technology, TANAKA Precious Metals, Nihon Superior, Nihon Handa, NBE Tech, Solderwell Advanced Materials, Guangzhou Xianyi Electronic Technology, ShareX (Zhejiang) New Material Technology, Bando Chemical Industries, etc. The global players competition landscape in this report is divided into three tiers.
