Research Summary

A single-phase immersion cooling system is a method of cooling electronic components or systems by immersing them in a dielectric fluid, typically a single-phase liquid coolant. In this system, the electronic components are fully submerged in the coolant, which absorbs heat generated by the components and dissipates it through convection. The coolant removes heat efficiently, maintaining the components at optimal operating temperatures while also providing electrical insulation and protection against environmental contaminants. Single-phase immersion cooling systems offer several advantages over traditional air or liquid cooling methods, including improved heat transfer efficiency, reduced energy consumption, quieter operation, and the ability to accommodate high-power-density applications. These systems are increasingly adopted in data centers, high-performance computing, cryptocurrency mining, and other industries where thermal management is critical for maintaining equipment reliability and performance.

The major global suppliers of Single-Phase Immersion Cooling System include Submer, GRC, Fujitsu, Asperitas, DCX The Liquid Cooling Company, TMGcore, Aliyun, etc. The global players competition landscape in this report is divided into three tiers.
