Research Summary

Single vision lenses are corrective lenses designed to correct vision problems such as nearsightedness (myopia), farsightedness (hyperopia), and astigmatism. Unlike multifocal lenses, which have different zones for near and far vision, single vision lenses have a consistent prescription power across the entire lens surface, providing clear vision at a specific distance, either for near or far vision, depending on the individual's visual needs. These lenses can be made from various materials, including glass, plastic, and polycarbonate, and can be customized to accommodate different prescriptions and preferences. Single vision lenses are commonly used in eyeglasses and contact lenses to correct refractive errors and provide clear, sharp vision for daily activities such as reading, driving, and working on a computer.
