### Research Summary

SLAM (Simultaneous Localization and Mapping) technology is a computational approach used in robotics and computer vision to enable autonomous systems to navigate and map unknown environments in real-time. It allows robots, drones, and other devices to concurrently estimate their own position relative to their surroundings (localization) while also constructing a map of the environment they are exploring (mapping). SLAM systems typically integrate various sensors, such as cameras, LIDAR, IMU, and odometry, to perceive their surroundings and gather spatial information. By continuously analyzing sensor data and correlating it with existing maps or previously collected data, SLAM algorithms enable these systems to adaptively and autonomously navigate complex and dynamic environments, making them indispensable for a wide range of applications, including autonomous vehicles, drones, mobile robots, and augmented reality.

The major global suppliers of SLAM Technology include Kuka, SMP Robotics, Google, Apple, Facebook, Parrot SA, Microsoft Corporation, Wikitude, NavVis, Aethon, Fetch
