Research Summary

A small waste incinerator with a daily capacity of 200 tons or less is a thermal treatment facility designed to dispose of solid waste through combustion. These incinerators are typically used in smaller communities, hospitals, industrial facilities, or remote areas where other waste management options like landfilling or recycling are limited. The incinerator burns waste at high temperatures, usually between 800°C to 1000°C (1472°F to 1832°F), converting it into ash, gases, and heat. The heat generated during combustion can be used for various purposes, such as generating steam for electricity production or heating buildings. Advanced small waste incinerators are equipped with emission control systems to minimize air pollutants released into the atmosphere, ensuring compliance with environmental regulations. These incinerators play a crucial role in reducing the volume of waste, minimizing environmental pollution, and recovering energy from the waste disposal process.
