Research Summary

An SMD thermistor, or surface-mount device thermistor, is a type of temperature sensor used in electronic circuits for measuring temperature changes. These thermistors are designed to be mounted directly onto the surface of a printed circuit board (PCB), making them suitable for automated assembly processes. Typically made of ceramic materials, SMD thermistors have temperature-sensitive resistance properties, with resistance decreasing as temperature increases (negative temperature coefficient, NTC). When exposed to temperature changes, the resistance of the thermistor changes accordingly, allowing it to sense temperature variations. SMD thermistors come in various package sizes, such as 0402, 0603, or 0805, indicating their dimensions in metric units, with smaller sizes being more compact. They find wide use in temperature monitoring and control applications across industries, providing accurate temperature measurement in a space-efficient design.

The major global manufacturers of SMD Thermistor include Thinking Electronic, TE Connectivity, Polytronics Technology Corporation, TDK Corporation, Shibaura, Shiheng
