Research Summary

Sodium fluorosilicate (Na_2SiF_6) is a synthetic, crystalline compound used primarily as a fluoridation agent in water treatment processes to prevent dental cavities. It is a white, odorless powder that dissolves in water, releasing fluoride ions. Sodium fluorosilicate is effective in adjusting fluoride levels in drinking water to the optimal concentration recommended for dental health, typically around 0.7-1.2 ppm (parts per million). Beyond water fluoridation, it is used in certain industrial applications such as metal surface treatment, as an additive in ceramic glazes, and in the production of other fluoride compounds. Sodium fluorosilicate is considered relatively safe when used in controlled concentrations for water treatment, but like other fluoride compounds, excessive exposure can lead to health risks such as dental fluorosis or skeletal fluorosis if ingested in high amounts over extended periods. Therefore, its use is carefully regulated and monitored to ensure public health benefits without adverse effects.

The major global manufacturers of Sodium Fluorosilicate include KC Industries, Prayon SA, Derivados delF?[?]or?DDF?, Kailin, Fluorine Industry Environmental, DFD Chemical,
