Research Summary

A solar cell module, also known as a photovoltaic (PV) module or solar panel, is a device that converts sunlight into electricity using photovoltaic cells. These modules consist of multiple interconnected solar cells encapsulated between protective layers of tempered glass, polymer resins, and back sheets. Solar cells within the module are typically made from semiconductor materials like silicon, which generate direct current (DC) electricity when exposed to sunlight. The electrical connections between cells are designed to create a series circuit to enhance voltage output. PV modules vary in size and power output depending on the number and efficiency of solar cells used. They are mounted on rooftops, ground-mounted structures, or integrated into building materials to capture solar energy and convert it into usable electricity for residential, commercial, and industrial applications. Solar modules play a crucial role in harnessing renewable energy, reducing dependence on fossil fuels, and mitigating greenhouse gas emissions, making them a cornerstone of global efforts toward sustainable energy production.
