Research Summary

Sonar systems, short for Sound Navigation and Ranging, are acoustic devices used to detect and locate objects underwater or in the air by emitting sound pulses and analyzing the echoes reflected back. These systems utilize the principles of sound propagation in water or air, where sound waves travel outward from a transducer (sound emitter) and bounce off objects in their path. By measuring the time delay and characteristics of these echoes, sonar systems can calculate the distance, size, shape, and sometimes the composition of objects in their vicinity. Sonar technology is employed in various applications including military operations for detecting submarines and underwater mines, maritime navigation to avoid collisions and map the seafloor, fisheries for locating fish shoals, and scientific research to study marine life and underwater geological features. Modern sonar systems use advanced signal processing techniques, multiple transducers, and sophisticated algorithms to improve accuracy, resolution, and range in different operating environments.

The major global manufacturers of Sonar Systems include Thales Underwater Systems,

Ultra Electronics, Northrop Grumman, Atlas Elecktronik, Lockheed Martin, Raytheon, Exelis, Kongsberg Mesotech, Sonardyne, L-3 Klein Associates, Furuno, Teledyne, DSME, Edge Tech, Haiying-Cal, HITARGET, etc. The global players competition landscape in this report is divided into three tiers.
