Research Summary

Soy protein isolate (SPI) and rapeseed protein isolate (RPI) are refined forms of plant-based proteins with distinct origins and properties. SPI is derived from soybeans through a process that removes most fats and carbohydrates, leaving a protein content of 90-95% by weight. It is known for being a complete protein, containing all essential amino acids necessary for human health, and is widely used in products like protein bars, shakes, meat substitutes, and baked goods due to its nutritional benefits and functional properties. RPI, on the other hand, is derived from rapeseed (canola) oil production by-products and undergoes similar processing to concentrate its protein content to around 85-90%. Like SPI, RPI is also considered a complete protein and is gaining recognition as a sustainable alternative protein source. It is utilized in similar food applications, offering nutritional benefits and contributing to the growing demand for plant-based proteins in global food systems.
