Research Summary

A spill containment berm is a flexible barrier designed to contain leaks and spills of liquids, particularly hazardous substances, within a specific area to prevent their spread and minimize environmental damage. These berms are typically made from durable materials such as PVC, polyurethane, or reinforced fabric, and are available in various sizes and configurations to suit different applications. Spill containment berms are used in industries such as oil and gas, chemical manufacturing, transportation, and agriculture, where there is a risk of spills during storage, handling, or transport of liquids. They are deployed around storage tanks, drums, machinery, or work areas to create a temporary or permanent barrier that can hold leaked liquids until they are safely recovered or disposed of. Spill containment berms play a crucial role in environmental protection by preventing contaminants from reaching soil, water sources, or other sensitive environments, thereby helping to ensure compliance with environmental regulations and maintaining workplace safety standards.
