### Research Summary

A spinal fusion cage is a medical device used in spinal surgery to stabilize and fuse two adjacent vertebrae together. It is typically made of biocompatible materials such as titanium or polymer and is designed to be placed between the vertebrae after the removal of damaged or diseased intervertebral discs. The cage provides structural support and maintains the proper alignment of the spine while allowing bone graft material to grow through and around it, facilitating the fusion of the vertebrae over time. Spinal fusion cages come in various shapes and sizes to accommodate different surgical techniques and patient anatomy. They are used to treat various spinal conditions, including degenerative disc disease, spinal fractures, and spinal deformities, aiming to reduce pain, restore stability, and improve spinal function.
