Research Summary

Spinal fusion is a surgical procedure performed to permanently connect two or more vertebrae in the spine. The goal of spinal fusion is to stabilize the spine, reduce pain, and prevent abnormal movement between vertebrae. During the procedure, the surgeon uses bone grafts, sometimes supplemented with implants such as rods, screws, or cages, to promote the growth of new bone between the vertebrae. Over time, the bone grafts fuse with the existing bone, creating a single, solid bone mass. Spinal fusion is commonly performed to treat conditions such as spinal fractures, degenerative disc disease, spinal deformities (like scoliosis), and certain types of spinal tumors. The procedure may be approached from the front (anterior), back (posterior), or side (lateral) of the spine depending on the specific condition being treated and the surgical technique chosen by the surgeon. Recovery from spinal fusion surgery can vary depending on the extent of the procedure and the individual patient's health, typically involving a period of rehabilitation and physical therapy to regain strength and mobility.

The major global suppliers of Spinal Fusion include Stryker Corporation, Medtronic, Zimmer Biomet, Depuy Synthes Companies, Globus Medical, B. Braun Aesculap,
