### Research Summary

Spinal retractors are surgical instruments used to gently hold and separate tissues and muscles during spinal surgery, providing the surgeon with clear access to the spine and surrounding structures. These retractors are designed to maintain a stable and unobstructed surgical field, allowing for precise visualization and manipulation of vertebrae, discs, nerves, and other anatomical features. Depending on the specific procedure and surgical approach, spinal retractors come in various types and sizes, such as lamina spreaders, Gelpi retractors, Caspar retractors, and more advanced retractor systems like the Bookwalter system. The proper use of spinal retractors is critical in ensuring the safety and effectiveness of spinal surgeries by minimizing tissue trauma, facilitating accurate surgical maneuvers, and promoting optimal patient outcomes.
