Research Summary

A spiral nanofiltration membrane is a specialized filtration technology used for separating and purifying liquids by selectively allowing certain molecules and ions to pass through based on their size and charge. Constructed from thin polymer layers with nanopores, these membranes are wound in a spiral configuration around a permeate collection tube to maximize surface area within a compact module. When pressurized feed solution flows through the membrane, smaller molecules and solvent permeate through the nanopores as purified permeate, while larger molecules, ions, and contaminants are retained and concentrated. This technology is crucial in applications such as water treatment for removing salts and organic compounds, wastewater treatment, and in various industrial processes requiring precise separation and purification capabilities.

The major global manufacturers of Spiral Nanofiltration Membrane include Dupont, Nitto, Toray, Suez Water Technologies, Vontron, Origin Water, Keensen, Jozzon Water, Wave-Cyber, Risingsun Membrane Technology, etc. The global players competition
