Research Summary

Sputter targets, also known simply as targets, are materials used in the sputtering process to deposit thin films onto various substrates. These targets are typically made from high-purity metals, alloys, oxides, nitrides, or other materials depending on the desired properties of the thin film being deposited. During sputtering, the target material is bombarded with high-energy ions, typically from a plasma generated by a noble gas like argon. This bombardment dislodges atoms or molecules from the target surface, which then travel in a straight line and condense onto a substrate placed in close proximity. The deposition forms a thin film with controlled thickness and uniformity, crucial for applications in industries such as semiconductor manufacturing, optical coatings, magnetic storage media, and decorative films. Sputter targets are engineered to withstand repeated sputtering cycles without degradation, ensuring consistent performance in thin film deposition processes critical for advanced technology applications.

The major global manufacturers of Sputter Targets include Materion (Heraeus), Linde,

JX Nippon Mining & Metals Corporation, Mitsui Mining & Smelting, Plansee SE, Hitachi Metals, Honeywell, Sumitomo Chemical, Konfoong Materials International Co., Ltd, TOSOH, ULVAC, Luvata, GRIKIN Advanced Material Co., Ltd., LT Metal, TANAKA, Longhua Technology Group (Luoyang) Co., Ltd., Fujian Acetron New Materials Co., Ltd, FURAYA Metals Co., Ltd, Umicore Thin Film Products, Advantec, Changzhou Sujing Electronic Material, Angstrom Sciences, etc. The global players competition landscape in this report is divided into three tiers.
