Research Summary

Static Random Access Memory (SRAM) is a type of volatile semiconductor memory that stores data using a network of connected transistors. Unlike Dynamic Random Access Memory (DRAM), SRAM does not require periodic refreshing to maintain data integrity, making it faster and more energy-efficient for certain applications. SRAM retains data as long as power is supplied to the device. It is commonly used in cache memories within CPUs, where quick access to frequently used data is critical for performance. SRAM chips are also used in embedded systems, networking equipment, and other applications requiring fast access times and low power consumption. Despite its advantages, SRAM typically has lower storage density and higher cost per bit compared to DRAM, limiting its use primarily to applications where speed and power efficiency are paramount.

The major global manufacturers of Static Random Access Memory (SRAM) include Cypress, Renesas, ISSI, GSI, Samsung, IDT, ON Semiconductor, Amic Technology,

Lyontek, etc. The global players competition landscape in this report is divided into three tiers.
