Research Summary

A Static Var Compensator (SVC) and a Static Var Generator (SVG) are advanced power electronic devices used to manage reactive power and enhance voltage stability in electrical power systems. An SVC operates by using a combination of thyristor-controlled reactors (TCRs) and thyristor-switched capacitors (TSCs) to dynamically adjust reactive power flow, thereby maintaining voltage levels and improving system stability. In contrast, an SVG, also known as a Static Synchronous Compensator (STATCOM), utilizes a voltage source converter (VSC) to provide fast and precise reactive power compensation by generating or absorbing reactive power directly. Both devices are essential for stabilizing voltage, improving power quality, and ensuring reliable operation of power grids, particularly in scenarios with rapid load changes or integration of renewable energy sources.
