Research Summary

A stationary emission control catalyst is a device used to reduce harmful emissions from stationary sources such as power plants, industrial facilities, and manufacturing plants. These catalysts are installed in exhaust systems where they facilitate chemical reactions that convert pollutants like nitrogen oxides (NO_x), carbon monoxide (CO), hydrocarbons (HC), and particulate matter (PM) into less harmful substances, such as nitrogen (N₂), carbon dioxide (CO₂), and water (H₂O). The catalyst typically consists of a substrate coated with a combination of precious metals like platinum, palladium, and rhodium, which serve as active sites for the reactions. By efficiently breaking down pollutants, stationary emission control catalysts play a critical role in meeting environmental regulations and reducing the impact of industrial activities on air quality.

The major global manufacturers of Stationary Emission Control Catalyst include Johnson Matthey plc, BASF, Cataler Corporation, Hailiang, Clariant International AG, Cormetech Inc, Corning Inc, DCL International Inc, UOP LLC (Honeywell), Guodian
