Research Summary

A steam and hydrogen peroxide biological indicator is a device used to verify the efficacy of sterilization processes, specifically those involving steam or hydrogen peroxide as sterilizing agents. These indicators contain spores of specific microorganisms known for their high resistance to the sterilization method being tested, such as *Geobacillus stearothermophilus* for steam and *Bacillus atrophaeus* for hydrogen peroxide. The biological indicator is placed in the sterilizer along with the items to be sterilized. After the sterilization cycle, the indicator is incubated to check for any surviving spores. If no growth is detected, it confirms that the sterilization process was effective. Biological indicators are considered the most reliable method for validating and monitoring sterilization processes in healthcare, pharmaceutical, and laboratory settings, ensuring that all microorganisms are effectively eliminated and that the sterilization equipment is functioning correctly.
