### Research Summary

Sterile surgical drapes are disposable barriers used to create a sterile field around the surgical site during surgical procedures. These drapes are typically made from nonwoven materials that are impermeable to liquids and microorganisms, such as polyethylene or polypropylene, to prevent contamination of the surgical site and reduce the risk of surgical site infections. Sterile surgical drapes are designed to be large enough to cover the patient and surrounding equipment, creating a sterile environment for the surgical team to work in. They may feature adhesive edges or fenestrations (openings) to accommodate the surgical site while maintaining a barrier around the surrounding area. Sterile surgical drapes are individually packaged and sterilized using methods such as gamma radiation or ethylene oxide gas to ensure their sterility until they are opened and used in the operating room. They are an essential component of surgical asepsis protocols and play a critical role in preventing postoperative infections and ensuring patient safety during surgical procedures.
