### Research Summary

Stirling cryocoolers are refrigeration systems based on the Stirling cycle, a thermodynamic process that uses compression and expansion of gases to achieve cooling. These cryocoolers are used to reach very low temperatures, typically below 100 Kelvin (-173 degrees Celsius), and are often employed in applications such as cryogenic research, medical imaging, infrared detectors, and satellite systems. Stirling cryocoolers typically consist of a displacer, piston, regenerator, and heat exchangers, all enclosed in a hermetically sealed housing. The working gas, usually helium or hydrogen, is compressed and expanded cyclically within the system, transferring heat from one end of the cooler to the other. As a result, one end of the cryocooler becomes cold while the other end dissipates heat. Stirling cryocoolers are known for their reliability, efficiency, and ability to reach very low temperatures without the need for cryogenic fluids such as liquid nitrogen or helium.

The major global manufacturers of Stirling Cryocoolers include Thales Cryogenics, Ricor, AIM, Sumitomo Heavy Industries, Eaton (Cobham), Honeywell, Sunpower, RIX

Industries, etc. The global players competition landscape in this report is divided into three tiers.
