Research Summary

A stretch blow molding machine is a type of machinery used in the manufacturing process of plastic bottles and containers. It is specifically designed to produce hollow plastic products from thermoplastic materials such as PET (polyethylene terephthalate). The process involves heating the plastic material until it becomes molten, then injecting it into a mold cavity where it is shaped into the desired bottle or container shape. Once the initial molding is complete, the machine utilizes a stretch rod or mandrel to stretch and blow air into the molded plastic, expanding it against the walls of the mold to achieve the final shape and size of the product. Stretch blow molding machines come in various configurations, including linear and rotary models, each offering different production capacities and efficiency levels. These machines are widely used in industries such as beverage packaging, personal care products, pharmaceuticals, and household goods, where lightweight, durable, and cost-effective plastic containers are in demand.

The major global manufacturers of Stretch Blow Molding Machine include SIDEL,
