Research Summary

Submerged arc welded (SAW) pipe is a type of steel pipe produced through a welding process where the welding arc is submerged under a granular flux layer. This method protects the weld area from contamination and oxidation, resulting in high-quality welds with excellent mechanical properties. Submerged arc welding is typically used to join large-diameter pipes and produce longitudinal weld seams. SAW pipes are commonly used in various industries, including oil and gas, water transportation, construction, and infrastructure projects. They are known for their strength, durability, and resistance to corrosion, making them suitable for applications requiring high-pressure and high-temperature resistance. SAW pipes are manufactured in a range of diameters and thicknesses to meet specific project requirements, and they can be coated or lined to enhance their performance and longevity in harsh environments. Overall, submerged arc welded pipes are essential components in the construction and maintenance of pipelines and other critical infrastructure worldwide.
