Research Summary

Supervisory Control and Data Acquisition (SCADA) is a system used in industrial settings to monitor and control processes, equipment, and infrastructure remotely. It consists of hardware and software components that collect data from sensors, instruments, and devices in real-time, allowing operators to monitor operations and make informed decisions. SCADA systems typically include Human-Machine Interface (HMI) software that provides a graphical representation of the processes being monitored, as well as programmable logic controllers (PLCs) or remote terminal units (RTUs) that interface with field devices. SCADA systems are widely used in industries such as oil and gas, water and wastewater management, electrical power generation and distribution, manufacturing, and transportation to improve efficiency, safety, and reliability by enabling centralized monitoring, control, and automation of critical infrastructure and processes.
