### Research Summary

Surgical clippers are specialized medical devices used to remove hair from a patient's body before surgical procedures. These clippers are designed to provide a close and efficient shave while minimizing the risk of skin irritation or injury. Surgical clippers typically feature a compact, handheld design with a small, oscillating blade or a series of cutting teeth attached to a motorized unit. The blades or cutting teeth are enclosed within a protective guard or comb to prevent direct contact with the skin and reduce the likelihood of nicks or cuts. Surgical clippers are commonly used in hospitals, surgical centers, and other healthcare settings to prepare patients for surgery by removing hair from the surgical site, such as the scalp, chest, abdomen, or limbs. Proper hair removal with surgical clippers helps to reduce the risk of surgical site infections and ensures a clean and sterile environment for the surgical procedure.
