Research Summary

Surgical drapes are sterile fabric or plastic sheets used to cover and isolate specific areas of a patient's body during surgical procedures. These drapes serve multiple purposes, including maintaining a sterile field by preventing contamination from non-sterile surfaces, protecting the patient from contact with surgical instruments and fluids, and providing a barrier to minimize the transmission of pathogens between the patient and surgical team. Surgical drapes are typically made from non-woven materials such as polypropylene or polyethylene, which are lightweight, fluid-resistant, and disposable. They are designed to conform to the contours of the patient's body and are often equipped with adhesive strips or fenestrations (openings) to facilitate positioning and access to the surgical site. Surgical drapes are an essential component of surgical asepsis and infection control protocols, helping to reduce the risk of surgical site infections and ensure safe and successful surgical outcomes.
