Research Summary

Surgical drills are specialized medical devices used by surgeons to create holes or openings in bones during surgical procedures. These drills are designed to provide precise and controlled drilling of bone tissue while minimizing trauma to surrounding tissues. Surgical drills typically consist of a handheld motorized unit with a rotating drill bit or burr attached to the end. The drill bit may vary in size, shape, and material composition depending on the specific surgical application and the type of bone being drilled. Surgical drills are commonly used in orthopedic surgery, neurosurgery, and maxillofacial surgery to prepare bone for the placement of screws, pins, plates, or implants, as well as for bone biopsies and other procedures. Surgical drills are equipped with features such as variable speed and torque settings, irrigation systems to cool the drill bit and remove debris, and depth stops or guides to control the depth of drilling. Ensuring the proper selection and use of surgical drills is essential to achieve optimal surgical outcomes while minimizing the risk of complications and tissue damage.

The major global manufacturers of Surgical Drills include Stryker, Medtronic, Zimmer Biomet, Johnson & Johnson, Smith & Nephew, Conmed, Brasseler, De Soutter Medical,
