Research Summary

Surgical robots designed for spinal procedures are specialized robotic systems used by spine surgeons to enhance precision, accuracy, and safety during spinal surgeries. These robotic systems consist of robotic arms equipped with surgical instruments and high-resolution cameras, controlled by the surgeon through a computer console in the operating room. Surgical robots for the spine provide several advantages, including improved visualization of the complex spinal anatomy, precise placement of implants and screws, and reduced risk of damage to surrounding nerves and tissues. By assisting surgeons in performing minimally invasive spinal procedures with greater accuracy and control, these robots can help minimize postoperative pain, reduce recovery times, and improve patient outcomes. Surgical robots for the spine are used in a variety of spinal procedures, including spinal fusion, discectomy, laminectomy, and spinal deformity correction. While surgical robots offer many benefits, they require specialized training for surgeons and surgical teams and significant investment in equipment and maintenance. Overall, surgical robots for the spine represent an advanced technology that holds great promise for improving the safety and

effectiveness of spinal surgeries.
