Research Summary

Sutures, also known as stitches, are medical devices used to hold tissues together during wound closure and healing. They are commonly used in surgical procedures, traumatic injuries, and minor cuts or lacerations. Sutures are typically made of biodegradable or non-biodegradable materials such as silk, nylon, polypropylene, or stainless steel, and come in various sizes, shapes, and configurations depending on the type of wound and tissue being repaired. The choice of suture material and technique depends on factors such as wound location, tension, and healing characteristics. Sutures can be classified into absorbable sutures, which break down and are absorbed by the body over time, and non-absorbable sutures, which remain in place indefinitely and may need to be removed after the wound has healed. Proper suture technique and placement are essential to promote wound healing, minimize scarring, and reduce the risk of infection.
