### Research Summary

A Synchronous Reluctance Motor (SynRM) is a type of electric motor that operates based on the principle of reluctance. Unlike conventional electric motors that use permanent magnets or wound rotor structures, SynRM utilizes a rotor with a simple construction featuring salient poles made of a magnetic material such as steel. The stator typically contains windings that create a rotating magnetic field when energized with alternating current. The rotor, being made of a material with high magnetic reluctance, tends to align itself with the rotating magnetic field, resulting in torque production. SynRM offers advantages such as high efficiency, low maintenance, and robustness due to its simplified rotor design. It is often used in applications where variable speed control, high efficiency, and reliability are essential, such as industrial machinery, pumps, fans, compressors, and electric vehicles. Additionally, SynRM technology is gaining popularity as a more environmentally friendly alternative to traditional motor designs due to its reduced dependence on rare-earth magnets.

The major global manufacturers of Synchronous Reluctance Motor (SynRM) include ABB, Siemens, KSB (REEL), Danfoss, Bonfiglioli, Oemer Motors, Relauto, Mark Elektriks, Nidec Leroy-Somer, Delta Electronics, Changzhou Nanfang Motor, etc. The global players competition landscape in this report is divided into three tiers.
