### Research Summary

Syndiotactic polystyrene (sPS) is a type of thermoplastic polymer characterized by a specific arrangement of its polymer chains. In sPS, the polymer chains have a syndiotactic arrangement, meaning that the side groups (styrene monomers) alternate in a regular, alternating fashion along the polymer backbone. This results in a highly ordered and crystalline structure, which imparts unique properties to syndiotactic polystyrene, including high stiffness, thermal stability, chemical resistance, and dimensional stability. sPS is commonly used in applications where these properties are desirable, such as in automotive components, electronic devices, packaging materials, and medical devices. Additionally, its high melt strength and processability make it suitable for various manufacturing processes, including injection molding, extrusion, and thermoforming.

The major global manufacturers of Syndiotactic Polystyrene include Idemitsu Kosan, LG Chem, etc. The global players competition landscape in this report is divided into three tiers. The first tier comprises global leading enterprises that command a substantial

market share, hold a dominant industry position, possess strong competitiveness and influence, and generate significant revenue. The second tier includes companies with a notable market presence and reputation; these firms actively follow industry leaders in product, service, or technological innovation and maintain a moderate revenue scale. The third tier consists of smaller companies with limited market share and lower brand recognition, primarily focused on local markets and generating comparatively lower revenue.
