Research Summary

Syngas, short for synthesis gas, is a mixture of gases primarily composed of carbon monoxide (CO) and hydrogen (H₂). It is produced by the gasification of carbon-containing materials such as coal, natural gas, biomass, or other hydrocarbons in a controlled environment with limited oxygen supply, typically at high temperatures. The resulting syngas can also contain other gases such as carbon dioxide (CO₂), methane (CH₄), water vapor (H₂O), nitrogen (N₂), and trace amounts of other compounds. Syngas is a versatile feedstock used in a variety of industrial processes, including the production of synthetic fuels (such as methanol and synthetic natural gas), chemicals (such as ammonia and methanol), and hydrogen. It is also utilized in the synthesis of higher-value products like plastics and pharmaceuticals. Syngas is considered an important component of the transition towards cleaner and more sustainable energy sources due to its potential for carbon capture and utilization, as well as its flexibility in various energy and chemical applications.

The major global manufacturers of Syngas include Linde, Air Liquide, Air Products, Hualu-Hengsheng, Yingde Gases, Sasol, etc. The global players competition landscape
