Research Summary

Synthetic vitamin E refers to a laboratory-produced version of the fat-soluble vitamin E, which occurs naturally in various foods and plant oils. It is typically synthesized through chemical processes from precursor molecules such as phenols or hydroquinones. Synthetic vitamin E, also known as dl-alpha-tocopherol, closely resembles the molecular structure and biological activity of natural vitamin E (d-alpha-tocopherol). It is commonly used as a dietary supplement and as an additive in food, cosmetics, and pharmaceutical products. Synthetic vitamin E offers advantages such as cost-effectiveness, stability, and consistency in potency compared to natural sources. While both synthetic and natural forms of vitamin E provide similar health benefits, some research suggests that natural vitamin E may have higher bioavailability and antioxidant activity. Nonetheless, synthetic vitamin E remains widely used and accepted as a safe and effective option for meeting dietary and nutritional needs.

The major global manufacturers of Synthetic Vitamin E include DSM, BASF, Adisseo, NHU, Zhejiang Medicine, PKU HealthCare, Beisha, Zhejiang Langbo, etc. The global
