Research Summary

A syringe filter is a disposable filter device designed to remove particles and microorganisms from liquids during the process of sample preparation or filtration. It consists of a plastic housing with a filter membrane attached, typically made from materials such as polypropylene or nylon. Syringe filters come in various sizes and pore sizes to suit different filtration needs and can be used with standard syringes. To use a syringe filter, the liquid sample is drawn into a syringe, and the filter is then attached to the syringe's tip. The liquid is then pushed through the filter membrane under pressure, trapping particles or microorganisms while allowing the filtered liquid to pass through. Syringe filters are commonly used in laboratories for applications such as sample clarification, sterilization, and removal of particulates prior to analysis by techniques such as HPLC (high-performance liquid chromatography) or GC (gas chromatography). They provide a convenient and efficient method for achieving high-quality filtration results in a wide range of scientific and research settings.

The major global manufacturers of Syringe Filter include Thermo Fisher, GE, Pall Corporation, Millipore, Advantec MFS, TPP, Sartorius Group, VWR, Membrane
