### Research Summary

Triallyl isocyanurate (TAIC) is a chemical compound used primarily as a crosslinking agent in the production of various polymers and elastomers. It is a tri-functional monomer containing three allyl groups and one isocyanurate ring, which enables it to react with polymer chains and form covalent bonds, thereby increasing the crosslink density and improving the mechanical properties of the resulting materials. TAIC is commonly used in the production of rubber compounds, thermosetting resins, and thermoplastic elastomers to enhance properties such as tensile strength, modulus, heat resistance, and chemical resistance. It is also employed as a coagent in combination with other crosslinking agents or additives to achieve specific performance requirements in various industrial applications, including automotive parts, wire and cable insulation, seals and gaskets, and molded products. TAIC plays a critical role in the manufacturing of high-performance polymer materials that are used in a wide range of industries and applications.

The major global manufacturers of TAIC (Triallyl Isocyanurate) include Evonik, Shinryo
