Research Summary

Telecentric lenses are specialized optical devices used in imaging and machine vision applications to produce images with consistent magnification and minimal distortion. Unlike conventional lenses, which focus light rays from different angles onto a single focal point, telecentric lenses ensure that light rays are parallel to the optical axis as they pass through the lens. This characteristic results in images where objects appear the same size regardless of their distance from the lens, making telecentric lenses ideal for precise measurements and accurate dimensional analysis. Telecentric lenses are commonly used in applications such as metrology, quality control, and inspection systems, where precise measurement and consistency in image magnification are essential. They are particularly useful for imaging objects with complex shapes or surfaces, as they minimize perspective distortion and ensure uniformity in image magnification across the entire field of view.

The major global manufacturers of Telecentric Lenses include Moritex Corporation, Sill Optics GmbH & Co. KG, KOWA Company.Ltd., Edmund Optics, Computar (CBC

Group), Jenoptik, Opto Engineering, VS Technology, Keyence Corporation, Kenko Tokina Co., Ltd., Schneider-Kreuznach, Zeiss, etc. The global players competition landscape in this report is divided into three tiers.
