Research Summary

Teledentistry is a branch of telehealth that utilizes telecommunications technology to provide dental care and consultation remotely. It involves the use of video conferencing, digital imaging, and other communication tools to facilitate virtual consultations, diagnosis, treatment planning, and follow-up care between dental professionals and patients. Teledentistry enables patients to access dental care from the comfort of their homes or remote locations, reducing the need for in-person visits to dental offices, especially in areas with limited access to dental services. Common applications of teledentistry include remote consultations for oral health concerns, patient education on oral hygiene and treatment options, and monitoring of treatment progress. While teledentistry has its limitations, such as the inability to perform hands-on procedures, it can improve access to dental care, increase efficiency, and enhance patient satisfaction by providing convenient and timely services.
