Research Summary

Telepresence video conferencing robots are robotic devices equipped with cameras, microphones, speakers, and displays that enable remote participants to attend meetings, conferences, or events virtually. These robots are designed to move autonomously or under remote control, allowing users to navigate and interact with their surroundings as if they were physically present. The built-in cameras and microphones provide live video and audio feeds to the remote participant, while the display allows them to see and hear the people in the meeting room in real-time. Telepresence robots offer a more immersive and interactive experience compared to traditional video conferencing systems, as they enable remote users to move around the space, engage with others, and participate in discussions more actively. They are commonly used in business, education, healthcare, and other sectors to facilitate remote collaboration, telecommuting, telemedicine, and remote learning initiatives, allowing users to overcome geographical barriers and connect with others from anywhere in the world.
