Research Summary

Teleprotection refers to the use of telecommunications technology to provide protection and control functions in electrical power systems. It involves the remote monitoring, supervision, and coordination of protective devices and systems used to safeguard power system equipment and ensure the reliable and secure operation of electrical networks. Teleprotection systems enable fast and accurate detection of faults, such as short circuits or line failures, and facilitate the rapid isolation and restoration of affected sections of the power grid to minimize disruptions and maintain system stability. These systems utilize various communication technologies, including fiber optics, microwave links, and digital telecommunication networks, to transmit protection signals and control commands between substations and other power system components. Teleprotection plays a critical role in enhancing the reliability, efficiency, and resilience of power systems by enabling coordinated protection and control actions over large distances, reducing the risk of cascading failures and blackouts.

The major global manufacturers of Teleprotection include ABB, Siemens, GE Energy,

Alcatel Lucent, Alstom, Nokia, Schweitzer Engineering Laboratories, TC Communications, RFL Electronics, etc. The global players competition landscape in this report is divided into three tiers.
