Research Summary

Telescopic boom lifts, also known as telescopic aerial lifts or cherry pickers, are specialized equipment used to elevate workers to elevated work areas. They are commonly used in construction, maintenance, and other industries where workers need to reach heights safely and efficiently. Telescopic boom lifts consist of a platform or basket attached to a telescoping arm, which can extend vertically and horizontally to reach high or difficult-to-access areas. The telescoping arm allows for greater reach compared to other types of aerial lifts, making them ideal for tasks such as installing signage, repairing roofs, trimming trees, and painting buildings. Telescopic boom lifts are available in various sizes and configurations, with different weight capacities, reach heights, and features to suit different applications and job site requirements. They are typically powered by diesel, electric, or hybrid engines and equipped with safety features such as guardrails, harness attachment points, and emergency descent systems to protect workers at height.
