Research Summary

A temperature and humidity logger is a compact electronic device used to measure, record, and monitor temperature and humidity levels in various environments over time. These loggers typically consist of sensors for temperature and humidity, data storage memory, a microprocessor, and a battery for power. They are designed to be placed in a specific location or attached to an object of interest, such as a room, storage facility, greenhouse, laboratory, or shipping container, to continuously monitor environmental conditions. Temperature and humidity loggers can capture data at regular intervals, ranging from seconds to hours, depending on the desired level of detail. Some loggers may also include additional sensors for measuring parameters such as pressure, light intensity, or voltage. The recorded data can be retrieved from the logger and analyzed using specialized software or transferred to a computer for further analysis, visualization, and reporting. Temperature and humidity loggers are widely used in various industries and applications, including food storage, pharmaceuticals, HVAC (heating, ventilation, and air conditioning), agriculture, manufacturing, and research, to ensure compliance with regulatory requirements, maintain product quality, and monitor

environmental conditions for safety and efficiency.
