Research Summary

Tert-butyl cumyl peroxide (TBCP) is a chemical compound commonly used as a free radical initiator in the polymerization of various monomers, particularly those containing unsaturated bonds such as styrene, vinyl acetate, and acrylic monomers. It belongs to the class of organic peroxides and is characterized by its ability to decompose at elevated temperatures, releasing free radicals that initiate polymerization reactions. TBCP is widely employed in the manufacturing of thermosetting resins, elastomers, coatings, adhesives, and foams, where it facilitates cross-linking and curing processes to achieve desired material properties such as strength, durability, and heat resistance. Additionally, TBCP is utilized in the production of polymer composites and as a curing agent for rubber compounds. Due to its reactivity and potential hazards associated with handling and storage, TBCP must be used with caution, following proper safety protocols and regulatory guidelines to minimize risks to personnel and the environment.
