Research Summary

Thallium-doped sodium iodide, commonly denoted as NaI(Tl), is a scintillation crystal used primarily in radiation detection and measurement applications. The addition of thallium (Tl) to sodium iodide (NaI) enhances its ability to convert incident gamma rays or X-rays into visible light photons through a process called scintillation. This emitted light can then be detected and converted into electrical signals by photomultiplier tubes or other detectors. NaI(Tl) crystals are widely used in gamma spectrometry systems, medical imaging devices (such as gamma cameras in nuclear medicine), environmental monitoring equipment, and homeland security radiation detection systems. Their high sensitivity, relatively low cost, and ability to provide energy resolution make NaI(Tl) crystals valuable in various fields where precise detection and measurement of ionizing radiation are essential.

The major global manufacturers of Thallium Doped Sodium Iodide NaI(Tl) include Luxium Solutions (Saint-Gobain), Hilger Crystals, Amcrys, Kinheng Crystal Materials
