Research Summary

Thermal rewritable film is a type of specialty film designed for thermal printing applications where the content can be erased and rewritten multiple times. This film typically consists of a layer that undergoes a reversible color change when exposed to heat. Thermal rewritable technology utilizes a thermal printhead to selectively apply heat to the film, causing the color to change and create text or images. What makes it unique is its ability to be erased by applying heat once again, allowing the film to be reused multiple times. This technology is commonly used in applications such as reusable labels, temporary signage, and dynamic information displays where frequent updates or changes are required without the need for additional consumables like ink or toner. Thermal rewritable film offers a sustainable and cost-effective solution for certain printing needs, minimizing waste and resource consumption.
